轴承选型计算主要考虑电机自身正常运转时轴承承受的载荷情况，而不考虑电机承受外部轴向或径向作用力。如产品设计选型时有特殊情况存在，如电机承受外部轴向或径向作用力、倾斜安装等，需重新进行轴承选型计算。

The calculation of bearing selection mainly considers the load of the bearing when the motor is running normally instead of considering external axial or radial forces which the motor should bear. In case special situation exists in product design selection, such as the motor withstands external axial or radial forces, oblique installation, etc., then the bearing selection should be re-calculated.

卧式电机的轴承寿命根据ISO281:1990来计算。基本额定寿命L10h是指在额定轴承负荷额定转速下，其中90%的轴承能回转到因转动疲劳而引起材料损伤之前的总运转小时数。YX2.0系列产品配套滚动轴承选型时，轴承基本额定寿命大多数可超过10万小时，不低于5万小时。

The service life of the bearing of horizontal motor is calculated according to ISO281:1990. The basic rating life L10h refers to that 90% of the bearings, at rated speed of rated bearing load, can return to total operating hours before material damage due to rotational fatigue. In the model selection of YX2.0 series products supporting rolling bearings, the basic rated life L 10h of most bearings can exceed 100,000 hours, not less than 50,000 hours.

电动机的起动 Start-up of motor

本系列电动机采用了先进的计算分析技术对电动机起动过程中每一点的定子绕组温升、转子铜排温度、端环温度等进行了详细的计算分析，确保电动机部件的最热点温度（如考虑起动集肤效应时转子铜排的最热点温度）在允许的范围内，避免了电动机因起动负荷过重而导致电动机早期损坏。

Advanced computational analysis technique has been applied in the series of motor to make detailed computational analysis of stator winding assembly temperature rise, rotor cooper bar temperature, end ring temperature at all points in motor starting process so as to ensure that temperature at the hottest point of motor component (e.g. consideration of hottest point temperature of the rotor copper bars in case of starting skin effect) is within acceptable limit and avoid motors from early damage arising from starting overload.
